

# CDC Releases 780,000 Previously Hidden COVID-19 Vaccine Injury Reports

After years of pretending COVID-19 vaccines were safe, the Centers for Disease Control and Prevention (CDC) recently released 780,000 of 7.8 million [free-text entries](#) from its V-safe database showing very early on that the shots weren't safe.

V-safe is a CDC "vaccine safety monitoring system" rolled out during the pandemic to monitor the safety of COVID-19 vaccines. The app allowed users to tell the agency how they felt after getting vaccinated in up to 250 characters. In other words, there were no "check the box" options with pre-selected adverse events.

"Completing health check-ins and sharing how you feel, even if you don't experience side effects after vaccination, helps CDC's vaccine safety monitoring efforts and lets others know what to expect in the days and weeks following vaccination," the CDC [states on its website](#).

However, data show roughly 523,150 people reported how they “felt” after [receiving a COVID-19 vaccine](#), and instead of disclosing the truths about these experimental gene therapy heart darts to the American people who pay their salaries, the agency continued to perpetuate a false narrative that COVID-19 vaccines were “safe and effective.”

Outside of a fever, rash, and swelling at the injection site, people were told their chances of experiencing anything else was almost nonexistent.

According to the data, the injuries reported include everything from seizures, Bell’s Palsy, blood clots, and myocarditis to miscarriages, tinnitus (ringing in the ears), shortness of breath, and testicular abnormalities.

Here are a few examples of entries received and suppressed by the CDC:

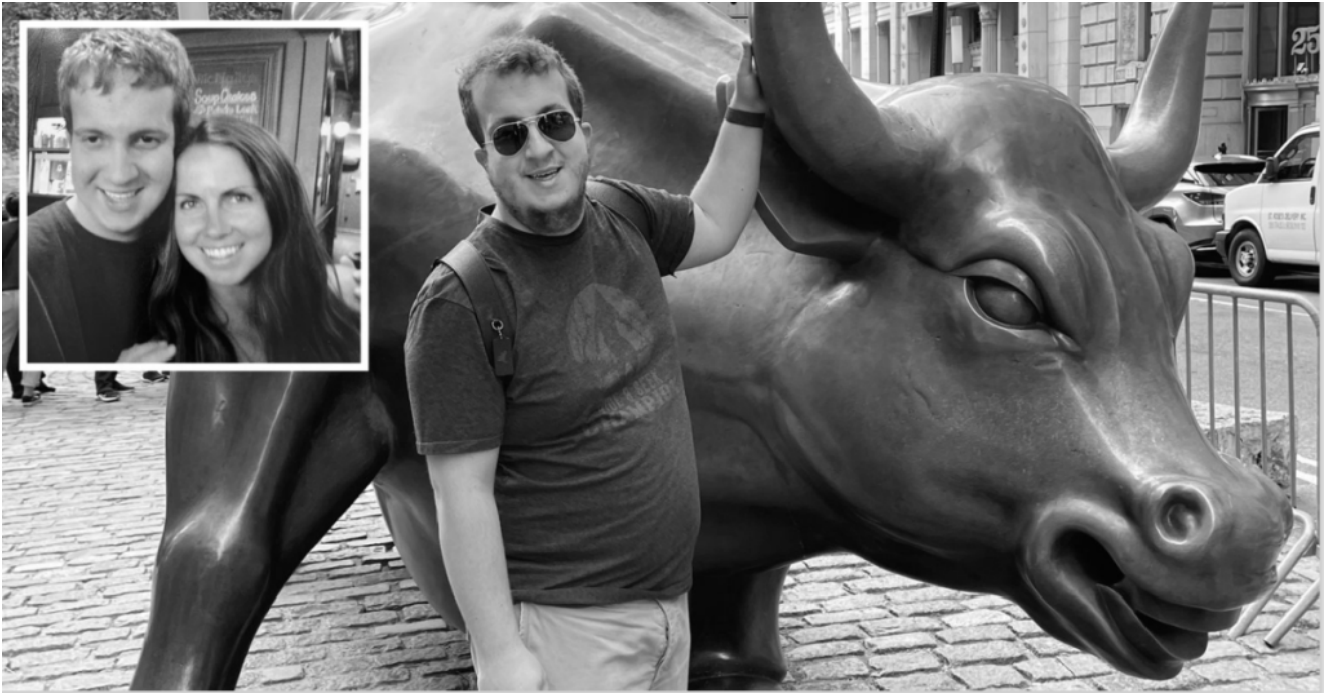

- “My tinnitus is off the charts. It is EXTREMELY LOUD. Had I know [sic] the vaccination would make my tinnitus worse I would have NEVER gotten the vaccine. Put it this way, if I was suicidal I would be dead by now thats [sic] how bad it is.”
- “My heart went into A Fibulation ...i have NEVER had this happen before in my life.”
- “I had miscarriage after 2nd dose of Pfizer covid vaccine. I felt fine until I had the vaccine and within 48 hrs pregnancy symptoms ceased. I have no history of fertility issues or complications and had 2 healthy uneventful pregnancies prior to this.”
- “Today, I experienced heart palpitations accompanied by tachycardia, dizziness, and weakness. These symptoms lasted about 4 hours and my heart rate was between 135-145. I have never experienced any of these symptoms until today.”
- “Loss of consciousness and seizure immediately following

- injection. Went to ER by ambulance.”
- “Left eyelid is dragging.”
  - “Chest tightness.”
  - “I have a growth in my right testicle area since the vaccine.”
  - “Miserable!! High fever and pounding headache. Very intense.”
  - “Syncope episode with loss of consciousness. , 14 hours after vaccine. Seen in ED for evaluation.”
  - “Overall body lymphatic swelling, started in face then went into neck, abdomen, groin and upper legs.”
  - “I feel like I’m jumping out of my skin”

Do you know how many people are living with ringing in their ears at the intensity of an Atlanta airport tarmac? Way too many according to the data—and the shot doesn’t even prevent COVID-19 or transmission of the virus that causes it.

In addition to more serious adverse events, there were numerous reports of itching, swollen lymph nodes, lymphedema, joint pain (a sign of an autoimmune reaction), autoimmune condition flare-ups, brain fog, fevers, body aches, rashes, COVID-like symptoms, tingling in limbs and on the side of the injection site, dizziness, hives. Many of these initial reactions can precede more severe reactions later on, such as neurological complications, paralysis, and death.

Remember 26-year-old [Joseph Keating](#)? He died from myocarditis after receiving Pfizer’s COVID-19 vaccine. His only symptoms were fatigue, muscle soreness, and an elevated heart rate—three conditions that repeat themselves repeatedly in the recent free-text releases.

Numerous families have lost loved ones to [Creutzfeldt-Jakob Disease](#), a rare, progressive, and always fatal neurodegenerative disorder. Their first symptoms were brain fog, confusion, headaches, and tingling in the arms and legs. There are thousands of these otherwise downplayed symptoms in the log.

It [took a lawsuit](#) for the American public to get access to these entries. Earlier data released in 2022 showed nearly 8% of the 10 million users needed medical attention or hospital care after vaccination.

Perhaps the CDC fought so hard to prevent the release of its V-safe data because it knew people wouldn't roll up their sleeves for a shot that could cause far more serious injuries than those associated with COVID-19.
