

How To Accidentally Die of COVID-19, According to the CDC

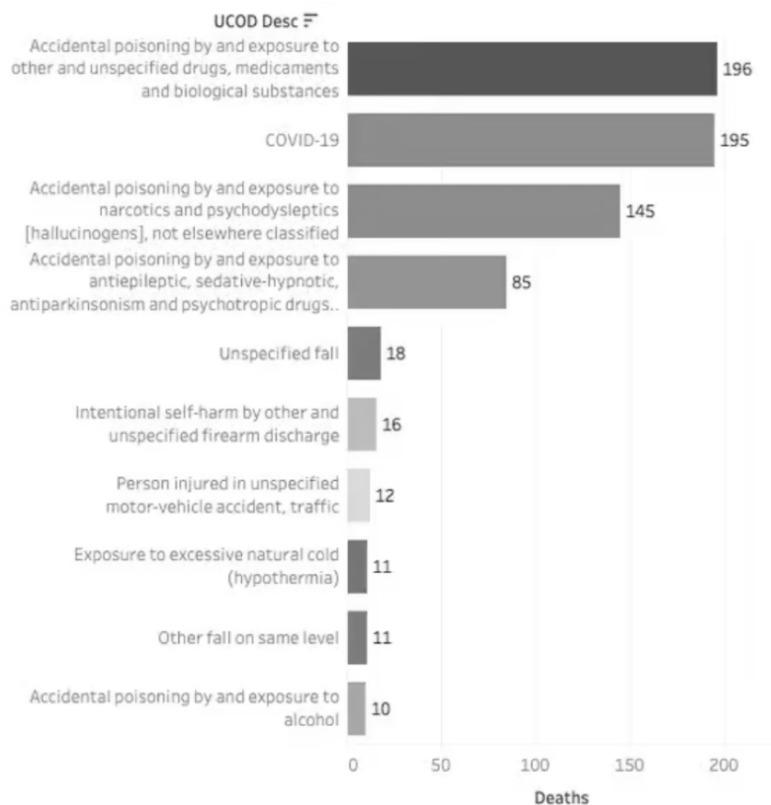

The CDC recently confirmed over 800 “accidental” Covid-19 deaths in 2021 for people under 60. These are deaths which obviously had little to do with Covid – but they logged them that way anyways. Here are 46 of those deaths from 2021; many just related to “falls” and others to events described.

CDC 2021 COVID-19 Confirmed Deaths

Types of Death (Accident, Homicide, Suicide)

Underlying Cause of Death Description

1. A 32-year-old white male died in December from an unspecified fall that resulted in an unspecified injury of the head, mental and behavioral disorders related to alcohol use, convulsions, and a kidney tumor. He also had COVID-19.
2. A 57-year-old white male died in November from an "other fall on the same level" that resulted in a rib fracture, injury of the liver or gallbladder, malaise and fatigue, syncope and collapse, and COVID-19.
3. A 56-year-old white male died in March from an unspecified fall that resulted in cardiac arrest, stroke, other intracranial injuries, COVID-19, hypertension, and diabetes. He also had mental and behavioral disorders related to tobacco use.
4. A 56-year-old white male died in January from a fall on and from stairs and steps that resulted in an unspecified injury of the neck, pneumonia due to food and vomit, hypertension, diabetes, and hyperlipidemia.

He also had COVID-19.

5. A 58-year-old white male died in February from a fall on and from stairs and steps that resulted in an unspecified injury of the head, intracranial injury, and accidental poisoning from alcohol. He also had hypertension and COVID-19.
6. A 56-year-old black male died in February from an unspecified fall that resulted in an unspecified injury of the head, chronic obstructive pulmonary disease, congestive heart failure, hypertension, and a surgical operation. He also had COVID-19.
7. A 42-year-old white female died in July from an unspecified fall that resulted in an injury of the spleen, pneumonia, mental and behavioral disorders related to alcohol use, and other unspecified cirrhosis of the liver. She also had COVID-19.
8. A 57-year-old white male died in February from an "other fall on the same level" that resulted in a diffuse brain injury, unspecified injury of the head, diabetes, hyperlipidemia, and COVID-19.
9. A 56-year-old white male died in June from an "other fall on the same level" that resulted in an unspecified injury of the head, pulmonary embolism, and COVID-19. He also had Down Syndrome and hypertension.
10. A 55-year-old black female died in January from an "other fall on the same level" that resulted in a traumatic subdural hemorrhage, a fracture of the neck of the femur, Huntington's disease, Parkinson's disease, and COVID-19.
11. A 59-year-old white female died in June from an "other fall on the same level" that resulted in an unspecified injury of the head, hypertension, atherosclerotic cardiovascular disease, and diabetes. She also had COVID-19.
12. A 55-year-old white male died in July from an unspecified fall that resulted in an unspecified injury, COVID-19, chronic kidney disease, and hypertension. He

also had atherosclerotic cardiovascular disease.

13. A 24-year-old white female died in September from an unspecified fall that resulted in a traumatic subdural hemorrhage, a skull and facial bone fracture, and an unspecified injury of the head. She also had COVID-19.
14. A 57-year-old American Indian or Alaskan Native male died in October from an unspecified fall that resulted in an unspecified injury, mental and behavioral disorders related to alcohol use, and an unspecified viral infection. He also had COVID-19.
15. A 57-year-old white male died in December from an unspecified fall that resulted in traumatic shock, superficial injury, and congestive heart failure. He also had COVID-19.
16. An accident occurred where a 57-year-old white man fell on the same level, resulting in an unspecified injury to his head. He had pre-existing conditions of diabetes and high cholesterol and also tested positive for COVID-19.
17. A 56-year-old white man fell in an accident and sustained an unspecified injury. He had a history of chronic kidney disease, heart disease, and diabetes and tested positive for COVID-19.
18. A 55-year-old black woman fell in an accident, suffering a traumatic brain injury and a broken thigh bone. She had pre-existing conditions of Huntington's disease, Parkinson's disease, and tested positive for COVID-19.
19. A 59-year-old white woman fell in an accident and sustained an unspecified injury to her head. She had pre-existing conditions of hypertension, heart disease, and diabetes, and also tested positive for COVID-19.
20. A 55-year-old white man fell in an accident and sustained an unspecified injury. He had a history of chronic kidney disease and heart disease and tested positive for COVID-19.
21. A 24-year-old white woman fell in an accident, suffering a traumatic brain injury and a broken skull and facial bones. She also tested positive for COVID-19.

22. A 43-year-old white man fell in an accident, suffered a traumatic brain injury, and tested positive for COVID-19 and pneumonia.
23. A 28-year-old American Indian or Alaskan Native man fell on and from stairs, sustaining an unspecified injury to his head. He had pre-existing conditions of liver and spleen enlargement and tested positive for COVID-19.
24. A 23-year-old white male died in February from suicide by intentional self-poisoning with non-opioid analgesics and exposure to hot objects, resulting in burns and cardiac arrest. He also had COVID-19.
25. A 38-year-old white female died in April from suicide by intentional self-poisoning with antiallergic and antiemetic drugs, ethanol, and benzodiazepines. She also had COVID-19 and unspecified depressive and anxiety disorders.
26. A 31-year-old white male died in August from suicide by intentional self-harm with an unspecified means, resulting in intracranial injury. He also had COVID-19, pneumonia, and unspecified drug poisoning.
27. A 27-year-old white male died in January from suicide by intentional self-harm with a firearm, resulting in open wounds to the head. He also had COVID-19, severe depression, and unspecified anxiety disorder.
28. A 22-year-old white male died in September from suicide by handgun discharge, resulting in an open wound to the head. He also had COVID-19, unspecified anxiety and depression, and an unspecified mental disorder.
29. A 55-year-old white male died in August from suicide by firearm discharge, resulting in open wounds to the head. He also had COVID-19, unspecified depression, diabetes, obesity, and hypertension.
30. A 45-year-old American Indian or Alaskan Native female died in November from suicide by jumping from a high place, resulting in head and neck injuries. She also had COVID-19, pneumonia, sepsis, and muscular dystrophy 7/
31. A 33-year-old white male died in September from suicide

by handgun discharge, resulting in open wounds to the head. He also had COVID-19, unspecified depression, and unspecified mental and behavioral disorders related to alcohol use.

32. A 31-year-old white male died in August from COVID-19, pneumonia, and unspecified drug poisoning, he also had respiratory failure and pneumothorax.
33. A 14-year-old American Indian or Alaskan Native female died in December from suicide by hanging, strangulation and suffocation, resulting in asphyxiation. She also had COVID-19, pneumonia, and unspecified depressive and anxiety disorders.
34. A 33-year-old white male died in July from suicide by hanging, strangulation, and suffocation, resulting in anoxic brain damage, cardiac arrest, and asphyxiation. He also had COVID-19 and unspecified depressive episode.
35. A 44-year-old white male died in October as a result of homicide by COVID-19. He also had acute respiratory failure, pneumonia, decubitus ulcer and pressure area, sequelae of injury of the spinal cord, and sequelae of other accidents.
36. A 57-year-old white male died in June from suicide by firearm discharge, resulting in intracranial injury, traumatic shock, and open wounds to the head. He also had COVID-19 and unspecified depressive episode.
37. A 37-year-old white male died in February from suicide by firearm discharge, resulting in open wounds to the head. He also had COVID-19, unspecified depressive episode, and hypertension.
38. A 38-year-old black male died in May as a result of homicide by firearm discharge, resulting in open wounds to the neck, trunk, and upper limb. He also had COVID-19.
39. A 42-year-old white male died in December from suicide by drug poisoning involving other opioids and benzodiazepines. He also had COVID-19, unspecified bipolar affective disorder, and unspecified infectious

diseases.

40. A 56-year-old white male died in September from suicide by firearm discharge, resulting in open wounds to the head and lip. He also had COVID-19 and unspecified infectious diseases.
41. A 55-year-old black male died in February as a result of homicide by rifle, shotgun, and larger firearm discharge, resulting in open wounds to the head and neck, upper limb. He also had COVID-19.
42. A 35-year-old white female died in March from suicide by drug poisoning involving calcium-channel blockers. She also had COVID-19, pneumonia, and unspecified drug poisoning.
43. A 33-year-old American Indian or Alaskan Native male died in January from suicide by a sharp object, resulting in the injury of the radial artery at the forearm level. He also had COVID-19.
44. A 21-year-old white male died in September from suicide by drug poisoning involving other synthetic narcotics and benzodiazepines. He also had COVID-19.
45. A 32-year-old white male died in April from suicide by hanging, strangulation, and suffocation, resulting in anoxic brain damage and asphyxiation. He also had COVID-19.
46. A 19-year-old black male died in February as a result of homicide by handgun discharge, resulting in multiple open wounds. He also had COVID-19 and unspecified infectious diseases.
