

# Pharma Continues to Ignore Growing Body of Evidence Showing COVID Vaccines Are Harmful

On Thursday, Joe Rogan and Marvel megastar Josh Brolin [traded stories](#) about the preponderance of Covid vaccine injuries among their friends. Brolin even described contracting “a mild case of Bell’s palsy” earlier this year, which Rogan attributed to the vaccine, noting he knew several people who suffered facial paralysis following Covid vaccination.

There is no perfect medicine. The benefits and harms of any treatment must be carefully considered in order to prescribe the safest, most effective course of action for a patient. While the FDA and CDC continue to extol the benefits of the Covid vaccines, they have ignored a growing body of evidence that these products can also be harmful. The code of medical ethics demands a transparent and balanced accounting of their impact on the American people. Only then can we set the best course for healthcare policy and future pandemics.

An honest accounting begins with clinical trials, supposedly “the most rigorous in history.” Pfizer’s own legal arguments suggest otherwise. Responding to a whistleblower lawsuit [alleging](#) major deviations from protocol, Pfizer’s lawyers [noted](#) that the company’s “Other Transactions Authority” agreement ([OTA](#)) with the Pentagon didn’t require clinical trials to comply with FDA regulations because the vaccine was a military [prototype](#) for “medical countermeasures.” This agreement allowed Pfizer to “grade its own homework,” so to speak – a point [emphasized](#) by DOJ lawyers in a separate filing in Pfizer’s support.

The FDA intended to keep Pfizer’s data [hidden for 75 years](#), but attorney Aaron Siri’s FOIA lawsuit [forced the agency to release them](#). Naomi Wolf’s DailyClout led 3,250 volunteer experts in analyzing more than 450,000 pages of internal Pfizer documents and uncovered massive harms ignored by the FDA, detailed in [\*The Pfizer Papers: Pfizer’s Crimes Against Humanity\*](#).

This effort revealed 1,233 deaths in the first three months of the vaccine rollout, and a litany of injuries: “industrial-scale blood diseases: blood clots, lung clots, leg clots; thrombotic thrombocytopenia, a clotting disease of the blood vessels; vasculitis, dementias, tremors, Parkinson’s, Alzheimer’s, epilepsies.”

These harms are echoed by data from [V-safe](#), a smartphone-based tool created by [the CDC](#). Among 10.1 million registered V-safe users, 7.7 percent [reported](#) side effects so serious they were compelled to seek medical care, many more than once.

The main culprit is the Covid spike protein encoded in the vaccine’s mRNA technology. This protein is an antigen, or foreign immunogenic substance, located on the outer coat of the SARS-CoV-2 virus, that triggers an immune response. The mRNA in the shots instructs the body’s cells to produce identical spike proteins, inducing the immune system to create

antibodies that bind to them, theoretically protecting vaccinated individuals against the virus. Unfortunately, this plan has a fatal flaw: The spike itself is toxic and potentially deadly.

Hundreds of peer-reviewed articles have [demonstrated](#) the spike's [potential for harm independent of the rest of the virus](#). Potential complications include myocarditis, blood clots, neurological injuries, and immune dysfunction. Pfizer's own pre-market biodistribution studies show that vaccine components [leave the injection site](#) in the arm and [penetrate](#) every major organ system within hours, where mRNA can [linger for weeks](#), forcing cells to churn out more and more of the toxic spike protein, which can [persist](#) for [months](#). There is [no way to predict](#) how much spike protein the mRNA injections will produce in any individual, and there is no "off switch."

According to [CDC figures analyzed in \*Toxic Shot: Facing the Dangers of the COVID "Vaccines,"\*](#) from 2021-2023 the US suffered 600,000 excess deaths not associated with Covid. Furthermore, Bureau of Labor Statistics data reveal that two million Americans became [newly disabled](#), with unusual excesses in historically low-risk groups.

These trends coincided with mass Covid vaccination, including an unaccountable 59 percent surge in deaths among Americans ages 15-44 in the third quarter of 2021 compared to 2019. Crucially Covid contributed only part of this excess mortality: in that quarter the US suffered around 201,000 excess deaths, with Covid officially accounting for 123,000, leaving [78,000 excess deaths](#) – 39 percent of the total – still unexplained.

[Similar figures from abroad underscore](#) a tragic loss of life among healthy people at minimal serious risk from the virus.

It could get worse. [No carcinogenicity studies](#) were performed

on the injections prior to their launch, thus long-term cancer risks are essentially unknown. The spike protein also appears prone to [prion-like misfolding](#), raising the specter of potential [neurodegenerative disorders](#).

Medical ethics demand a balanced approach to every intervention, weighing potential benefits against potential harms. However, in the case of the Covid vaccines, federal agencies have chosen only to proclaim benefits. By surfacing data that bear upon both the positive and negative impacts of the Covid vaccines, and evaluating the pandemic performance of CDC, FDA, and other health agencies, the new administration can restore confidence and integrity in medicine and public health.
